

# Important Concept in Javascript.

## Javascript Execution Context

NOTE:- Different Environment has different Global Execution context, but in browser the global execution context is referred to variable "this" which is a window Object

There are usually two phases Context

↳ Global Execution Context

↳ Function Execution Context

phases are :-

Code

Memory Creation phase

Execution phase.

Let's understand with small Example.

```
let val1 = 10  
let val2 = 5
```

```
function addNum (num1, num2) {  
  let total = num1 + num2  
  return total  
}
```

```
let result1 = addNum (val1, val2)  
let result2 = addNum (6, 5)
```

Execution Steps :

① Global execution.

this

② Memory Creation phase.

val1 → undefined

val2 → undefined

addNum → defination

result1 → undefined

result2 → undefined

} cycle of

Execution phase

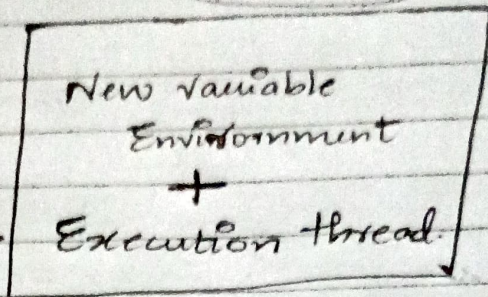

val1  $\leftarrow$  10

val2  $\leftarrow$  5

addNum

Sandbox

The memory phase & Execution phase takes place for addNum function

Memory phase  
val1  $\rightarrow$  undefined  
val2  $\rightarrow$  undefined  
total  $\rightarrow$  undefined

① Global Execution

Execution phase.  
num1  $\rightarrow$  10  
num2  $\rightarrow$  5  
{total}  $\rightarrow$  15

returns

$\Rightarrow$  After the Execution of function the ~~new~~ Sandbox is deleted automatically
